

(a) Sensitivity vs. correction need

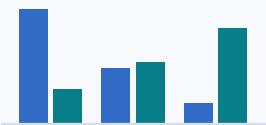

Predictions match: $p_t = q$

Fisher can remain nonzero

No correction: $u = 0, G = 0$

Prediction gap: $p_t \neq q$

$p_t - q \longrightarrow u = -\nabla_h \text{KL}/d$

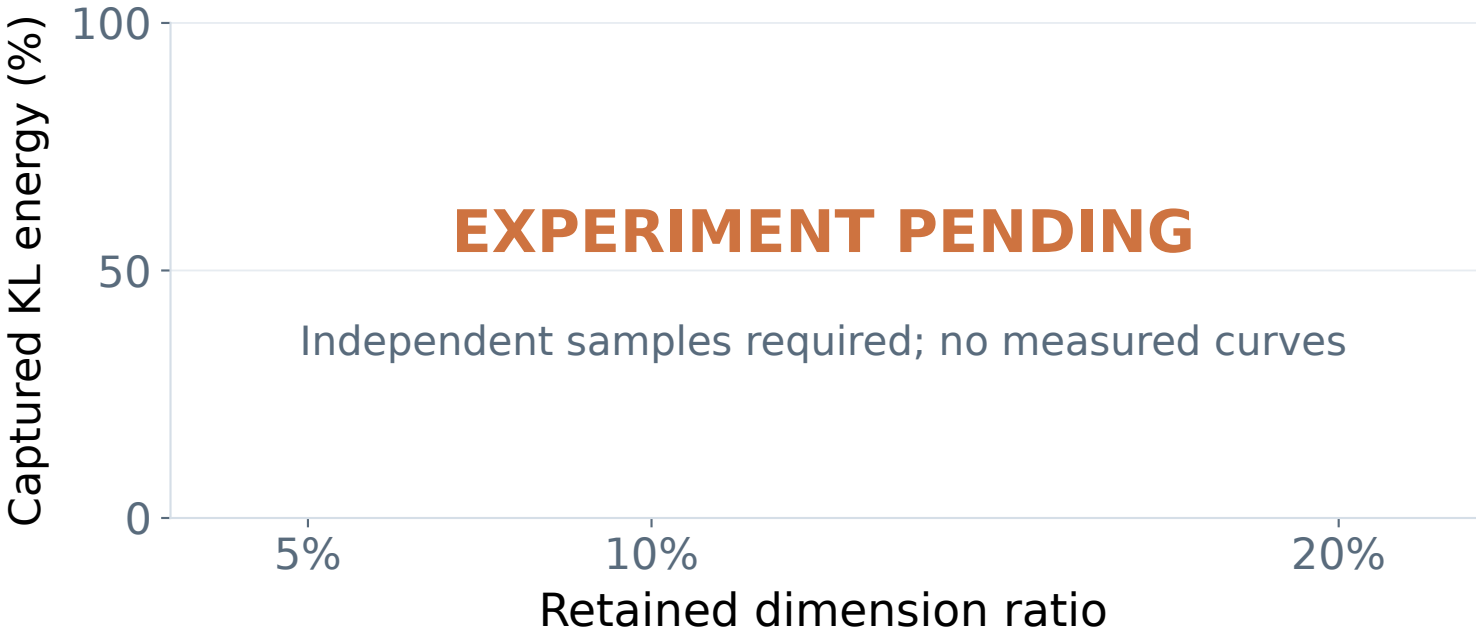

Output weighting: $G = \mathbb{E}[uu^\top]$

Schematic only

p_t : expert

q : current

(b) Do the directions capture current corrections?

Planned:

Current Fisher

Initial correction

Current correction
